

# EXIT TERMINAL

## Exit terminal

Keyprocessor-Scanton has designed a state-of-the-art exit terminal that ensures the highest possible through-flow speed. Ergonomics, ease of operation, high accessibility and easy maintenance combine to ensure that motorists instantly know what they are supposed to do. They can consequently complete the process at top speed and quickly free up the terminal for the next visitor. This prevents the formation of traffic jams.

## For all applications

The terminal operates the barrier and registers the date and time that users exit the facility. The large display is easy to read, even in direct sunlight, and provides users with specific instructions for each phase of the process, possibly in multiple languages. With the standard model motorists insert the bar code card they received at the entry terminal into the card reader. In order to optimise the ease of use, a motorised transport mechanism is used to automatically insert the card into the reader and, depending on the card type, return it to the

motorist. This avoids mistakes and mishaps. Payment upon leaving the facility using a credit card, chip card or registration via a subscription reader or number plate recognition is also possible as an option. When a tariff is not charged, for instance when the first hour of parking is free, users are not required to first validate the ticket at the ticket machine.

## Models

The exit terminal is made of high-quality steel and painted with a double coating. The unit comes with a five-year guarantee against corrosion. The standard colour of the base and the roof of the casing is grey/black (RAL 7021), the colour of the unit is alu white (RAL 9006) and the centre front panels are red (RAL 3020). The casing can be supplied in all standard RAL colours on request. The exit terminal comes standard with thermostat-controlled heating. A subscription reader, credit card reader and intercom can be easily installed in the exit terminal. The card insertion module is robust and instantly recognisable. The terminal can

be installed on a concrete pedestal or another flat and stable surface.

## Options

The exit terminal can be delivered with the following features:

- With bar code and optionally in combination with:
  - Number plate recognition to prevent fraud
  - Subscription reader (bar code or proximity, long distance reader or number plate recognition)
  - Credit card reader
  - Chip card reader
- With various types of intercoms
- With camera (TCP/IP) for video recording

## Placement & Installation

Keyprocessor-Scanton provides optimum service and will be pleased to place and install the exit terminal on a turnkey basis, including providing and laying the foundations, cabling and detection loops. All the terminals are fitted with a large service door. This means that the components are easily accessible for maintenance.
